# Ball Nut Design & Lead Accuracy

## Ball Nut Type: F / D

The type F and D ball nut utilize internal ball returns of cast steel. The ball returns are captured in the ball nut to prevent the returns from coming out of the assembly during ball recirculation. This design allows for high DN (rotation speed) as well as high translational speeds when compared to external or end type ball returns.

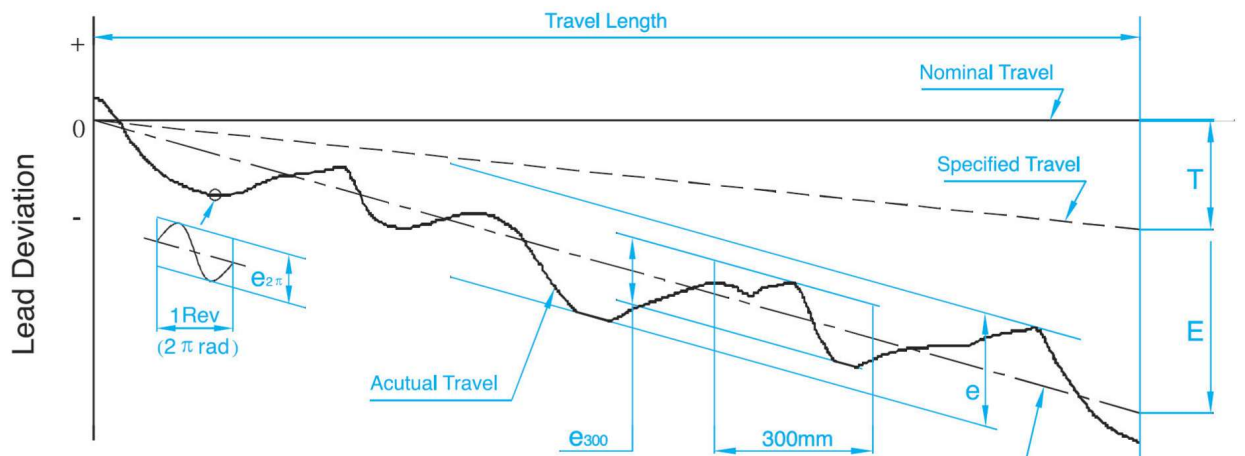

## Ball Nut Type: E

The type E ball screw is a high lead ball screw with end style ball returns. The high lead ball screws allow for high translation rates while maintaining lower critical speeds.

## Lead Accuracy

- The ball screws offered by Alpha have an accumulated travel deviations of grade C7 and C10. The value allowable per 300mm measured at any portion of the thread is 0.05mm for C7 and 0.21mm for C10.

**NOTE 1: (S.L.I.P) Simple to Drop Into Your Design**

Engineers spend hours trying to get ball screw assemblies correct. By the time a design engineer has to create their own ball screw assembly, they need to (1) correctly specify the direction of the nut, (2) select the correct end bearings, (3) select the correct ball screw end machining & (4) figure out how to build a motor mount and (5) add a coupling. For many engineers, this can take days and there still are errors made. The Fangtooth Perfect Ball Screw Assembly is all in one.

**NOTE 2: (S.L.I.P) Longer Ball Screws at Higher Speeds.** Critical whip is always a ball screw issue. The longer the screw, the slower you need to spin it. But the standard aggressive leads on the Fangtooth ZeroTOOTH (02TH) allows high linear speeds. A 10mm lead needs to spin 4 times faster than a 40mm lead. The trick is the precision gearing in the ZeroTOOTH perfect motor mount.

**NOTE 3: (S.L.I.P) Increased Ball Screw L10 Life**

Slowing down the speed of the screw can quadruple its bearing life. For example, a 40X10 (40mm Diameter & 10mm lead) screw must spin at 3000 rpm to move at 500 mm/s. But using a 40X40 screw, it must only spin at 750 rpm. Adding a 10:1 gearbox adjusts the 40X40, in effect to a 40X10. Every revolution of the ball screw the bearings move in and out of the load zone much slower, which significantly reduces the bearing metal fatigue, thus extending the life of the ball nut.

**NOTE 4: (S.L.I.P) Perfect Motor Mount on the Fangtooth Ball Screw Assembly.**

Often ball screw integrations fail the motor coupling due to ball screw misalignment, but also the fixed thrust bearing is in the way of the motor mount. This assembly uses a clever float input and gearbox combination to solve both issues. The gearbox pilots on center for perfect alignment, acts as the float bearing and eliminates a coupling.
